

GOLDANALYTIX MagneticScreenScale - Magnetic Balance

Information sheet „Safe Handling“

Very strong magnetic field

The integrated magnet has a strong and far reaching magnetic field (even more than 20 cm). This might damage TVs, notebooks, data carriers, wristwatches, credit cards and other similar objects.

Bruising

The magnet is so strong that even slight inattention can lead to body parts (like fingers) being clamped in between the magnet and another object. This may lead to bruising for several weeks.

Danger for heart pacemakers

Do not let the magnet get close to people with heart pacemakers. This may cause potentially life threatening damage. Please warn patients from getting too close to the magnet.

Risk of ignition

If the magnet gets damaged the produced dust may become inflamed.

Danger for Kids, allergy sufferers and with collisions

Do not let the magnet get into the hands of **kids**!

The magnets are coated with nickel. Some people are **allergic to nickel**. Please avoid long skin contact with the magnet if the protection sticker got removed or damaged.

If the magnet **collides** with an object **splinters** may develop, which could fly several meters and might injure eyes or other body parts.
